Summary of research outputs

Articles: 94 articles in leading international journals such as *Nature*, *PNAS*, *Nature Plants*, *Trends in Ecology & Evolution*, *Biological Reviews*, *New Phytologist*, *Methods in Ecology & Evolution*, *Journal of Ecology*, *American Naturalist*.

Citations: > 22900 total citations, > 1000 citations yr⁻¹, 33 papers cited > 100 times each, H-index of 46 [Google Scholar].

Datasets: I have led production of three large compilations: AusTraits, the Biomass and Allometry Database, and the Coral Traits Database, and contributed to others (Tallo, GWDD, TRY).

Software: I have co-led development important software packages, including APCalign, traits.build the statistical package SMATR (used in over 2300 publications) and the growth model, plant.

Research highlights

Global shift towards trait-based ecology: My research has enabled global quantification and comparison of plant strategies by i) proposing four leading traits to capture global plant diversity, now quantified for many of the world's species (Westoby *et al* 2002, 3912 cites); ii) Developing methods enabled comparison of light capture among species (Falster *et al* 2003, 663 cites); iii) Quantifying a global trade-off in how conductive tissue in stems is arranged (Zanne *et al* 2010, 604 cites).

Trait-based community assembly: My work shows how tradeoffs in plant function mediate species coexistence and how we can predict trait mixtures from first principles (Falster *et al* 2017, 152 cites).

Global rules of plant competition: Using growth data from > 3 million trees in plots across the world, Kunstler *et al* 2016 (1128 cites) shows how functional traits influence competitive interactions.

AusTraits: Co-led development of AusTraits, Australia's foremost plant trait database, and associated software, such as the R package APCalign, traits.build. Used widely in Australia by researchers and practitioners (Falster *et al* 2021, 227 cites).

The Biomass and Allometry Database: Synthesises data collected in 176 different studies to create the world's largest, public database on individual plant allometry (Falster *et al* 2015, 254 cites).

How traits influence plant growth: My work explains why the effect of traits on growth changes with size, via models (Falster *et al* 2011, 2016, 2018, 401 cites) & meta-analysis (Gibert *et al* 2016, 227 cites).

Why do large parents have large offspring?: I showed how size-asymmetric competition among rival offspring explains this phenomena, unifying theory across taxa (Falster *et al* 2008, 254 cites).
